

Analytical Methods for Chemical Agents at Workplaces

Help 

Substances may be retrieved by either chemical name, CAS-No. or EINECS-No..
In all data fields **fragment searching** is enabled and recommended for retrieval.

Example:

Searching for ethyl

will retrieve every substance containing ethyl in its name.

Search entries in different fields (e. g. name and CAS-No.) are linked by a **logical "AND"**.

Klicking the "Search" button or the Return key will initiate the search.

An empty search will retrieve all data sets.
